Comments provided by: Company-Manufacturer, FI

General information

In Finland most of our factories are located near forest. We have lot of rats and mice outside our factories. It is very important to kill rats and mice outside, so they are not coming inside factory. We have tested electric traps, but they don't work. Rats are not going inside the traps.

Alternative Identity and Properties

Warfarin and other anticoagulants agents should be allowed to use also in future, because not poisoning traps are not working well.

Conclusion on suitability and availability of the alternative

Alternatives are not so effective than anticoagulants.

Other Comments

If we use other traps than for instance warfarin, it is more expensive and results are bad.
