

As real estate agency in the West Indies, I recommend regularly to my clients to use the Senti Tech process (hexaflumuron), because it's the only technique sustainably that allows eradicate different species of subterranean termites without degradation of the building, without risk to man and the environment.

The treatment Senti Tech (hexaflumuron) is discreet, doesn't pollute, no health risk, not any gene during use.

The Hexaflumuron product allows complete destruction of nests of termites and not the temporary treatment of infestation, while soils abound always de these even parasites.

In conclusion, the loss of Hexaflumuron in the West Indies would lead to serious problems of termite control in the future.

Indeed, our climates help the proliferation of termites (constant heat and humidity).
