

HEXAFLUMURON

Bait against termites TP 18 BPR

Hemaflumuron is used in a formulation at a concentration of 0.5 w/w from Dow Agrosiences in order to eradicate termites. The technic employed is a bait. The formulation was first CTB-P+ certified in 1996 and was improved during those years (presentation of the cellulosic matrix) in order to be more effective on a largest range of termites species, to shorten delay of eradication, the content of hexaflumuron remaining the same. Direct exposure to environment and human is very limited, that was positively taken into consideration by the members of the tox / ecotox commission of the CTB-P+ Mark when it gave its positive advice for its certification.

RECRUTE PRO, the name of the formulation currently CTB-P+ certified, is at present the only one used in baits able to control the termite species *Coptotermes*, very present in the tropical areas (like Ile de la Reunion, French Guyana), that termite species being at the origin of very severe degradations in buildings in those countries.

If ever more information is needed, I stay at your disposal.

Sincerely yours
