

## **Biocidal Products Committee (BPC)**

Opinion on the application for approval of the active substance:

Azoxystrobin

**Product type: 7** 

ECHA/BPC/167/2017

Adopted 3 October 2017

## **Opinion of the Biocidal Products Committee**

on the application for approval of the active substance azoxystrobin for product type 7

In accordance with Article 8(4) of Regulation (EU) No 528/2012 of the European Parliament and of the Council 22 May 2012 concerning the making available on the market and use of biocidal products (BPR), the Biocidal Products Committee (BPC) has adopted this opinion on the approval in product type 7 of the following active substance:

Common name: Azoxystrobin

**Chemical name:** Methyl( $\underline{E}$ )-2-{2[6-(2-cyanophenoxy)pyrimidin-4-

yloxy]phenyl}-3-methoxyacrylate

EC No.:

**CAS No.**: 131860-33-8

New active substance

This document presents the opinion adopted by the BPC, having regard to the conclusions of the evaluating Competent Authority. The assessment report, as a supporting document to the opinion, contains the detailed grounds for the opinion.

### Process for the adoption of BPC opinions

Following the submission of an application by LANXESS Deutschland GmbH on 13 April 2014, the evaluating Competent Authority United Kingdom submitted an assessment report and the conclusions of its evaluation to the ECHA on 1 December 2016. In order to review the assessment report and the conclusions of the evaluating Competent Authority, the Agency organised consultations via BPC (BPC-22) and it's Working Groups (WG III2017). Revisions agreed upon were presented and the assessment report and the conclusions were amended accordingly.

Information on the fulfilment of the conditions for considering the active substance as a candidate for substitution was made publicly available at <a href="https://echa.europa.eu/addressing-chemicals-of-concern/biocidal-products-regulation/potential-candidates-for-substitution-previous-consultations">https://echa.europa.eu/addressing-chemicals-of-concern/biocidal-products-regulation/potential-candidates-for-substitution-previous-consultations</a> on 10 February 2017, in accordance with the requirements of Article 10(3) of Regulation (EU) No 528/2012. Interested third parties were invited to submit relevant information by 11 April 2017.

## Adoption of the BPC opinion

## Rapporteur: United Kingdom

The BPC opinion on the approval of the active substance azoxystrobin in product type 7 was adopted on 3 October 2017.

The BPC opinion takes into account the comments of interested third parties provided in accordance with Article 10(3) of BPR.

The BPC opinion was adopted by consensus. The opinion is published on the ECHA webpage at: <a href="http://echa.europa.eu/regulations/biocidal-products-regulation/approval-of-active-substances/bpc-opinions-on-active-substance-approval">http://echa.europa.eu/regulations/biocidal-products-regulation/approval-of-active-substances/bpc-opinions-on-active-substance-approval</a>.

## Detailed BPC opinion and background

#### 1. Overall conclusion

The overall conclusion of the BPC is that the azoxystrobin in product type 7 may be approved. The detailed grounds for the overall conclusion are described in the assessment report.

#### 2. BPC Opinion

#### 2.1. BPC Conclusions of the evaluation

## a) Presentation of the active substance including the classification and labelling of the active substance

This evaluation covers the use of azoxystrobin in product type 7. Azoxystrobin belongs to the strobilurin class of fungicides and acts by inhibition of mitochondrial respiration. Specifications for the reference source are established.

The physico-chemical properties of the active substance and biocidal product have been evaluated and are deemed acceptable for the appropriate use, storage and transportation of the active substance and biocidal product.

Validated analytical methods are available for the active substance as manufactured (and formulated product) and for the relevant and significant impurities. However, a validated method for the determination of the z-isomer in the product is required.

Validated analytical methods are available for the relevant matrices Water, Soil, Air and Blood. However a validated method is required for Tissues.

A harmonised classification according to Regulation (EC) No 1272/2008 is available. However, a classification proposal was submitted to ECHA by the UK in March 2017 to amend the existing harmonised classification by removing "\*" and adding M-factors. The dossier has undergone an accordance check and was made available for public consultation in July 2017.

The classification and labelling for azoxystrobin according to (CLP Regulation) is:

(Current) Classification according to the CLP Regulation			
Hazard Class and Category	Acute Toxicity category 3*		
Codes	Aquatic Acute 1		
	Aquatic Chronic 1		
Labelling			
Pictogram codes	GHS06		
	GHS09		
Signal Word	Danger		
Hazard Statement Codes	H331		
	H400		
	H410		
<b>Specific Concentration</b>			
limits, M-Factors			
Justification for the proposal			

The proposed classification and labelling for azoxystrobin according to Regulation (EC) No 1272/2008 (CLP Regulation) is:

(Proposed) Classification according to the CLP Regulation		
Acute Toxicity category 3		
Aquatic Acute 1		
Aquatic Chronic 1		
GHS06		
GHS09		
Danger		
H331		
H400		
H410		
M = 10 (acute) and 10 (chronic)		

#### Justification for the proposal

Azoxystrobin has a harmonised classification of Acute Tox. 3\* H331 Toxic if inhaled. The data provided (Parr-Dobrzanski (1992)) supports this classification.

#### Acute category 1 consideration:

Aquatic a.s endpoints are <1 mg a.s/L (fish LC<sub>50</sub> 0.47 mg/l, crustacean EC<sub>50</sub> 0.055mg/l, algae  $E_rC_{50}$  0.146 mg/l) and therefore acute category 1 is required. M factor of 10 (>0.01 to  $\leq$  0.1).

#### Chronic category 1 consideration:

Fish NOEC 0.147 mg a.s/L, crustacean NOEC 0.00954 mg a.s/L, algae NOEC 0.02 mg a.s/l. Active classified as chronic category 1 based on these species and assumption of 'not' readily biodegradable. M factor of 10 (>0.001 to  $\le 0.01$ ).

## b) Intended use, target species and effectiveness

Azoxystrobin is used in biocidal film preservative products which are applied to, or incorporated into various end-applications like paints, silicon coatings, mineral and silicon sealants and grout products. Products containing azoxystrobin will be used by industrial users while the end-use treated items may be used by professionals and non-professionals indoors.

Azoxystrobin acts through the inhibition of mitochondrial respiration (inhibition of Complex III: cytochrome bc1 (ubiquinol oxidase) at the Qo site (cyt b gene)).

The data on azoxystrobin and the representative biocidal product have demonstrated sufficient efficacy against the target species.

Azoxystrobin has a single site mode of action and therefore there is the potential for resistance development. However, as it is intended that azoxystrobin will normally be used in conjunction with other fungicides, this restricts the potential for resistance to develop.

## c) Overall conclusion of the evaluation including need for risk management measures

#### Human health

Azoxystrobin is classified as Toxic by inhalation following acute exposure, but is of low oral and dermal toxicity. Azoxystrobin does not meet the classification criteria for skin, eye and respiratory tract irritation or skin sensitisation. In repeated dose studies, the liver was identified as the target organ for toxicity. Azoxystrobin does not meet the criteria for

classification as a mutagen, carcinogen or reproductive toxicant.

The table below summarises the exposure scenarios assessed.

Summary table: human health scenarios for PT7			
Scenario	Primary or secondary exposure and description of scenario	Exposed group	Conclusion
Industrial production of preserved water-based paints/coatings and sealants.	Primary exposure to biocidal product – industrial worker mixing/loading representative biocidal product into automated machinery and associated handling of equipment in the production of water-based paints, coatings and sealants.	Industrial operator	Acceptable without PPE.
Brush and roller application of ready- to-use water-based paints/coatings	Primary exposure to preserved paints – an adult applies the treated article using a brush and roller	Professional	Acceptable without PPE.
Washing out contaminated brushes	Primary exposure to preserved paints – an adult cleans out a brush contaminated with the treated article using an appropriate solvent	Professional and non- professional	Acceptable without PPE.
Spray application of ready-to-use water- based paint/coatings	Primary exposure to preserved paints – an adult applies the treated article using a handheld sprayer	Professional	Acceptable without PPE.
Cleaning of spray equipment	Primary exposure to preserved paints – an adult cleans out the spray tank and contaminated equipment	Professional	Acceptable without PPE.
Application of mineral sealant/fillers using a mastic gun	Primary exposure to preserved sealant or fillers – an adult applies treated article between joints from a cartridge using a mastic gun	Professional	Acceptable without PPE.
Removal of paint/coating by sanding or abrasion	Secondary exposure to preserved paint— an adult removes treated article by sanding or abrasion	Professional	Acceptable without PPE.
Removal of paint/coating by chemical stripping	Secondary exposure to preserved paint— an adult removes treated article using paint remover and scratching tool	Professional	Acceptable without PPE.
Removal of sealant by manual stripping	Secondary exposure to preserved sealant – an adult removes treated article by cutting and stripping	Professional	Acceptable without PPE.
Brush and roller application of ready- to-use water-based paints/coatings	Primary exposure to preserved paint – an adult applies the treated article using a brush and roller	Non- professional	Acceptable.
Spray application of ready-to-use water-based paint/coatings	Primary exposure to preserved paint – an adult applies the treated article using a handheld sprayer	Non- professional	Acceptable.

Cleaning of spray equipment	Primary exposure to preserved paints – an adult cleans out the spray tank and contaminated equipment	Non- professional	Acceptable.
Application of mineral sealant/fillers using a mastic gun	Primary exposure to preserved sealant or fillers – an adult applies treated article between joints from a cartridge using a mastic gun	Non- professional	Acceptable.
Removal of paint/coating by sanding or abrasion	Secondary exposure to preserved paint— an adult removes treated article by sanding or abrasion	Non- professional	Acceptable.
Removal of paint/coating by chemical stripping	Secondary exposure to preserved paint— an adult removes treated article using paint remover and scratching tool	Non- professional	Acceptable.
Removal of sealant by manual stripping	Secondary exposure to preserved sealant – an adult removes treated article by cutting and stripping	Non- professional	Acceptable.
Contact with wet treated surfaces	Secondary exposure to preserved material – a young child (toddler) touches wet surfaces applied with treated articles	General Public	Acceptable.
Ingestion of paint chips containing the biocidal product	Secondary exposure to preserved paint – a young child (toddler) touches and ingest dry paint chips	General Public	Acceptable
Volatised residues of azoxystrobin	Secondary exposure to volatilized residues – a bystander inhales volatilised residues of azoxystrobin from treated articles in enclosed unventilated spaces	General Public	Acceptable

Primary exposure of industrial users to the representative product during mixing and loading showed acceptable risk without the use of PPE.

Acceptable risk without the use of PPE was identified following primary exposure of professional and non-professional users:

- to the film preserved paint following application by brush and roller and spray;
- to the film preserved sealant/filler following application using a mastic gun; and
- following cleaning of the equipment.

Secondary exposure of professionals and non-professionals via removal of preserved material showed acceptable risk without use of PPE.

Secondary exposure of the general public to preserved materials showed no unacceptable risks.

A dietary risk assessment was not undertaken as exposure to food from the use pattern is not expected.

#### **Environment**

Azoxystrobin is stable to hydrolysis under environmental conditions. The whole system  $DegT_{50}$ 's for both water sediment systems exceed the criteria for both persistent (P) and very persistent (vP). In soil laboratory and field studies (in the dark) the criteria for P and/ vP was triggered for several soils. Azoxystrobin has a medium to low potential for mobility in soil. There is no indication of bioaccumulation potential for azoxystrobin. Azoxystrobin is toxic to aquatic organisms (in particular to aquatic invertebrates). As a result, toxic (T) criteria is triggered.

Azoxystrobin can degrade via hydrolysis to form R401553 and R402173, or via microbial degradation to form R234886. R401553 and R402173 were not observed in sediment in freshwater sediment systems. R401553 has a high to low potential mobility in soil, whilst R402173 is classified as having a medium to very high mobility. R402173 exhibits pH dependent adsorption with maximum adsorption occurring under acidic conditions. R401553 and R402173 are considered potentially P or vP. R234886 is hydrolytically stable. Degradation and adsorption in soil was found to be pH dependent with degradation rates and the potential for leaching greater at higher pH values. R234886 fulfils the criteria for P properties and is potentially vP. R234886, R402173 and R401553 are unlikely to bioaccumulate and are not considered to be toxic to aquatic organisms.

Azoxystrobin has a low vapour pressure which together with the intended use suggests that emissions to air will be negligible. Vapour pressure was not determined for the metabolites.

The table below summarises the exposure scenarios assessed
--

Summary tab		
Scenario	Description of scenario including environmental compartments	Conclusion
Formulation and indoor use of paints (aqueous based).	Environmental compartments: STP, aquatic (freshwater), terrestrial, groundwater, atmospheric.	Atmospheric: acceptable STP: acceptable Aquatic: acceptable Terrestrial: acceptable Groundwater: acceptable RMM not required.
Indoor application and service-life of grouts and sealants in urban areas (city scenario).	Environmental compartments: STP, aquatic (freshwater), terrestrial, groundwater, atmospheric.	Atmospheric: acceptable STP: acceptable Aquatic: acceptable Terrestrial: acceptable Groundwater: acceptable RMM not required.

Acceptable risks are identified for the atmospheric compartment, STP, terrestrial and aquatic compartments.

For groundwater all PECgw values were  $< 0.1~\mu g/L$  and therefore the trigger value for groundwater in all scenarios is not exceeded.

## Overall conclusion

Acceptable uses have been identified for both human health and the environment when azoxystrobin is used in biocidal products for the preparation and indoor use of paints coatings, mineral sealants and fillers.

## 2.2. Exclusion, substitution and POP criteria

### 2.2.1. Exclusion and substitution criteria

The table below summarises the relevant information with respect to the assessment of exclusion and substitution criteria:

Property		Conclusions	
CMR properties	Carcinogenicity (C)	no classification required	Azoxystrobin does not fulfil criterion (a),
	Mutagenicity (M)	no classification required	(b) and (c) of Article 5(1).
	Toxic for reproduction (R)	no classification required	
PBT and vPvB properties	Persistent (P) or very Persistent (vP)	vP R401553: potential P or vP R402173: potential P or vP R234886: potential P or vP	Azoxystrobin does not fulfil criterion (e) of Article 5(1).
	Bioaccumulative (B) or very Bioaccumulative (vB)	Not B or vB R401553, R402173 and R234886: not B or vB	does fulfil criterion (d) of Article 10(1).
	Toxic (T)	T R401553, R402173 and R234886: not T	
Endocrine disrupting properties	Azoxystrobin is not considered to have endocrine disrupting properties. Azoxystrobin does not fulfil criterion (d) of Article 5(1).		
Respiratory sensitisation properties	No classification required. Azoxystrobin does not fulfil criterion (b) of Article 10(1).		
Concerns linked to critical effects	Azoxystrobin is not considered to have any concerns linked to critical effects and therefore it does not fulfil criterion (e) of Article 10(1)		
Proportion of non-active isomers or impurities	Azoxystrobin does not fulfil criterion (f) of Article 10(1).		

Consequently, the following is concluded:

Azoxystrobin does not meet the exclusion criteria laid down in Article 5 of Regulation (EU) No 528/2012.

Azoxystrobin does meet the conditions laid down in Article 10 of Regulation (EU) No 528/2012, and is therefore considered as a candidate for substitution.

The exclusion and substitution criteria were assessed in line with the "Note on the principles for taking decisions on the approval of active substances under the BPR" and in line with "Further guidance on the application of the substitution criteria set out under article 10(1) of the BPR" agreed at the 54th and 58th meeting respectively, of the representatives of Member States Competent Authorities for the implementation of Regulation 528/2012 concerning the making available on the market and use of biocidal products. This implies that the assessment of the exclusion criteria is based on Article 5(1) and the assessment of substitution criteria is based on Article 10(1)(a, b, d, e and f).

#### 2.2.2. POP criteria

Azoxystrobin fulfils the criteria for classification as vP and T, but not vB. Azoxystrobin does not have the potential for long-range transport. Therefore, azoxystrobin does not fulfil the criteria for classification as a POP.

#### 2.2.3. Public consultation for potential candidates for substitution

A public consultation regarding azoxystrobin PTs 7, 9 and 10 took place from 10 February 2017 to 10 April 2017. At the end of this period, 2 submissions were received (including one from the applicant supporting azoxystrobin) arguing against the proposal for classification as Toxic for the environment. No information on alternatives was received.

The following active substances are approved for PT 7 and are not candidates for substitution: fludioxonil, folpet, propiconazole and tolylfluanid.

# 2.3. BPC opinion on the application for approval of the active substance azoxystrobin in product type 7

In view of the conclusions of the evaluation, it is proposed that azoxystrobin shall be approved and be included in the Union list of approved active substances, subject to the following specific conditions:

1. Specification: minimum purity of the active substance evaluated: 965 g/kg.

There are 4 relevant impurities:

Z-isomer – maximum content 7 g/kg Toluene - maximum content 2 g/kg Methanol - maximum content 5 g/kg Dimethylformamide - maximum content 0.1 g/kg

- 2. Azoxystrobin is considered a candidate for substitution in accordance with Article 10(1)(d) of Regulation (EU) No 528/2012.
- 3. The authorisations of biocidal products are subject to the following condition(s):

The product assessment shall pay particular attention to the exposures, the risks and the efficacy linked to any uses covered by an application for authorisation, but not addressed in the Union level risk assessment of the active substance.

<sup>&</sup>lt;sup>1</sup> See document: Note on the principles for taking decisions on the approval of active substances under the BPR (available from https://circabc.europa.eu/d/a/workspace/SpacesStore/c41b4ad4-356c-4852-9512-62e72cc919df/CA-March14-Doc.4.1%20-%20Final%20-%20Principles%20for%20substance%20approval.doc)
<sup>2</sup> See document: Further guidance on the application of the substitution criteria set out under article 10(1) of the BPR (available from https://circabc.europa.eu/d/a/workspace/SpacesStore/dbac71e3-cd70-4ed7-bd40-fc1cb92cfe1c/CA-Nov14-Doc.4.4%20-%20Final%20-%20Further%20guidance%20on%20Art10(1).doc)

4. The placing on the market of treated articles is subject to the following condition(s):

The person responsible for the placing on the market of a treated article treated with or incorporating the active substance azoxystrobin shall ensure that the label of that treated article provides the information listed in the second subparagraph of Article 58(3) of the Regulation (EU) No 528/2012.

The active substance does not fulfil the criteria according to Article 28(2)(a) to enable inclusion in Annex I of Regulation (EU) 528/2012 as it is Acute Tox 3 (H331), Aquatic Acute 1 (H400), Aquatic Chronic 1 (H410), and is very persistent (vP) and Toxic (T) in the environment.

### 2.4. Elements to be taken into account when authorising products

- 1. The active substance, azoxystrobin, is considered as a candidate for substitution, and consequently the competent authority shall perform a comparative assessment as part of the evaluation of an application for either national or Union authorisation.
- 2. Although azoxystrobin has shown innate efficacy, it is not intended to be used as a stand-alone substance; it is intended to be used in combination with other fungicides to prevent the development of resistance.

### 2.5. Requirement for further information

Sufficient data have been provided to verify the conclusions on the active substance, permitting the proposal for the approval of azoxystrobin.

However, further data on the active substance are required and should be provided to the evaluating Competent Authority (UK) as soon as possible but no later than the date of approval of the active substance:

- Determination of the relevant impurity z-isomer of azoxystrobin;
- Validated method of analysis for the determination of azoxystrobin in tissues, with an appropriate LOQ;
- Ames test on a representative batch of azoxystrobin.
